How to Install this Program:1) Download it. How to Install this Program:2) Use WinZip. Go to "Extract" option.3) Now extract the download zip file into any folder of your PC. How to Install this Program:4) Once you're done extracting this, click on the icon of.exe file and run it. How to Install this Program:5) Follow the on-screen instructions. Note: Ensure that you've installed adobe photoshop cs3 properly before installing this keygen.

Despite recent advances in prostate cancer treatments, such as surgical and radiation therapies, most patients eventually succumb to metastatic prostate cancer. Prostate cancer, like most other cancers, is an inherently heterogeneous disease, which accounts for the wide variations in treatment responses and overall patient survival. To date, we do not have a clear understanding of the mechanisms by which prostate cancer cells maintain and enhance their metastatic potential. The purpose of this project is to identify new pathways that promote prostate cancer metastasis. Previously, we have shown that the oncogene transcription factor, SP1, plays a critical role in regulating prostate cancer metastasis. These studies have suggested that in addition to the known SP1 regulated genes, the expression of a novel class of genes, called the SP1-induced genes, is regulated by SP1. Furthermore, we have shown that this novel SP1-induced gene class is highly expressed in prostate cancer and may be critically involved in prostate cancer metastasis. We now propose to characterize the SP1-induced gene class and identify novel SP1-regulated metastasis genes in prostate cancer. The following specific aims are designed to address the hypothesis that the SP1-induced gene class plays a role in the metastatic processes in prostate cancer: 1) We will first identify and characterize the SP1-induced gene class using novel subtractive library screens and whole genome expression analysis. 2) We will then determine if the SP1-induced gene class is functionally involved in prostate cancer metastasis. The SP1-induced gene class will be functionally investigated by characterizing the in vitro metastatic potential of prostate cancer cells and by monitoring the ability of prostate cancer cells to colonize the bone in vivo. Furthermore, we will attempt to identify the target genes of the SP1-induced gene class using in vitro cDNA array analysis. 3) To determine if the SP1-induced gene class plays a role in other cancers, we will attempt to determine if the SP1-induced gene
